MOSSI EPIL®

Avocado Wax Discs 1 kg

Intermediate texture depilatory wax with avocado essence

Intermediate waxes do not dry quickly, which allows the professional to apply wax and remove it with adequate time. Its characteristics mean that there is good adhesion to the hair. It is important to highlight that all intermediate waxes facilitate their use in both the winter and summer seasons. Being intermediate, their texture makes epilation less painful. The avocado essence in the wax makes the skin soft, benefiting when used for epilation on dry skin.

Usage : Melt the wax in the indicated device, keeping it at the appropriate temperature. It is advisable to apply with a disposable wooden spatula. To apply the wax to the skin, spread the wax using a spatula in the direction of hair growth. When the wax is of an appropriate texture in the area to be waxed, remove the wax, pulling in the opposite direction to the hair growth, holding the skin with the other hand.

Warning : Check the "Watt" power and whether your equipment has a thermostat. The power will identify the thickness of wax you should use (consult your sales representative). If the heater does not have a thermostat, it will cause overheating, causing more electricity consumption, increasing the temperature of the wax and altering its elasticity, especially on days when there are fewer waxes. The professional must advise his client that under no circumstances should he expose himself to the sun or UV light (sunbed) on the day of epilation. No cosmetic product or treatment that causes cold (cryotherapy) or hyperemia (thermal) should be applied to the skin on the same day or the day after epilation. Failure to respect this warning will increase the risk of blemishes and skin irritation.

Product for external use. For professional use.

INGREDIENTS: Colophonium, Glycol rosinate, Triethylene glycol rosinate, Microcrystalline wax, Paraffin, Liquid paraffin, Peg-8 dioleate, Titanium dioxide, Persea gratissima oil, C.I. 19140+42090.
