MOSSI EPIL®

Creamy Shea Wax Discs 1 kg

Intermediate texture depilatory wax

Intermediate waxes don't dry quickly, which allows the professional to apply and remove the wax at the right time. Its characteristics mean that it adheres well to the hair. It's important to note that all intermediate waxes are easy to use in both the winter and summer seasons. Being intermediate, its texture makes epilation less painful.

Usage : Melt the wax in the device indicated, keeping it at the appropriate temperature. It is advisable to apply with a disposable wooden spatula. To apply the wax to the skin, spread the wax with a spatula in the direction of the hair growth. When the wax has reached an appropriate texture in the area to be waxed, remove the wax by pulling in the opposite direction to the hair growth, holding the skin with the other hand.

Warning : Check the power " Watt " and whether your equipment has a thermostat. The wattage will identify the thickness of wax you should use (check with your dealer). If the melter doesn't have a thermostat, it will overheat, causing more electricity consumption, increasing the temperature of the wax and altering its elasticity, especially on days when there are fewer epilations. Professionals must advise their clients that under no circumstances should they be exposed to the sun or UV light (solarium) on the day of the epilation. No cosmetic product or treatment that causes cold (cryotherapy) or hyperaemia (thermal) should be applied to the skin on the day of or the day after the epilation. If you disregard this warning, you increase the risk of skin blemishes and irritation.

Product for external use. For professional use.

INGREDIENTS: Colophonium, Glycol rosinate, Microcrystalline wax, Paraffin, Liquid paraffin, Peg-8 Dioleate, Titanium Dioxide, Butyrospermum parkII
